New peptide nucleic acid (PNA) oligomers are provided which (a) consist of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation AUG region, 5' untranslated region (5' UTR), 3' untranslated region (1' UTR), splice junctions or coding sequence of a human immunodeficiency virus gene cohesen from env, gag, pol, rev and tar. The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene requiring HIV processes. Hence they can be used to treat AIDS and other viral infections. They are also useful in diagnostic applications and as stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the first PNA strand binds with the sequence of nucleobases) the presents expense of nucleobases) targetting HIV genes. The present sequence is a primer used in a method for monitoring antihepailtis B virus (HBV) drug resistance in a patient by genetic detection of any one of mutations 1228M, MS52V/I and/or V/L/MS55I in HBV DNA polymerase in a biological sample from the patient. The method is useful in the field of genetic detection of anti-HBV drug resistance during HBV therapy. The method is rapid, reliable and precise
                                                                                                                Monitoring anti-HBV drug resistance by genetic detection of mutations in DNA polymerase of HBV in patient's sample, involves hybridizing the polymucleic acids of the sample with a probe and detecting the hybrid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Map of wheat D genome comprising the genome location of a microsatellite marker, useful for e.g. identifying genes responsible for a desired phenotypic trait, especially quantitative trait loci in wheat, and

The invention relates to a map of the bread wheat D genome comprising the genome location of a microsatellite marker selected from a group of 185 cuch markers (ABQ221913-ABQ29217). The invention also encompasses the use of left (ABQ2218-ABQ29317). The invention also encompasses the use of left (ABQ2218-ABQ29317). The invention also encompasses the use of left (ABQ2218-ABQ293102) and right (ABQ33103-ABQ39387) primers to amplify and detect the microsatellite markers, and to identify genes consisting of a diploid genomes designated A, B and b, resulting from two successive intercrossings involving at least three allohexaploid species. The D genome is thought to have been introduced in the most recent intercrossing, between the amphipoid ABMB and Triticum tauschii (DD), probably involving genome, the large size of its genome, both species. Due to its polyploid genome, the large size of its genome, and its low level of polymorphism, the genetic mapping of wheat has to date been difficult. Microsatellites are tandemly repeated sequences between one and six nucleotides long, and are very polymorphic in length, minimally due to polymerase slippage during replication. This high degree of polymorphism makes them especially suitable for the genetic mapping of species which show little intraspecies polymorphism, such as wheat. In the intraspecies polymorphism, such as wheat. In the intraspecies polymorphism, such as wheat. In the intraspecies polymorphism, when the large size of its grantic makes them especially suitable for the genetic mapping of intervience of species which show little intraspecies polymorphism, such as wheat. In the intraspecies polymorphism when the large size of its didition, microsatelline are codominant, and exhibit Mendelian developed from the ancestral diploid donor species Triticum tanschiant character. The 185 microsatellite markers of the invention are developed from the ancestral diploid donor species Triticum tauschiand developed from the ancestral diploid donor species Triticum tauschiand the marker Diploid donor species Triticum tauschiand the markers thus help to overcome some of the genomes. These microsatellite markers thus help to overcome some of the problems associated with the generic mapping of wheat. The wheat Discome invention are useful for identifying genes responsible for a phenotypic trait of interest, most notably QTLS (quantitative trait loci). In particular they may be used for analysing genes and alleles implicated in discase and for identifying development factors, quality factors and factors conferring resistance to pathogens and xenobiotics. The microsatellite markers and associated primers may be used in mapping and genotyping diploid and polyploid species of Triticum comparation, or related species; for identifying cultivars and hybrids of Triticum and related species; to assess whether or not a product comprises wheat or a related species; and to assess whether or not a product comprises genetically. The present seems seems to an examen. ·; MINIOUS TO Standardise OS field? Gaps Antisense oligonucleotide Al.3 for IL-13 alpha' receptor inhibition. This is an antisense oligonucleotide directed against the interleukin-13 is involved in immunoglobulin E (IgE) production, the development and persistence of asthma and atopy. The invention relates to antisense oligonucleotides directed against a nucleic acid sequence encoding either a chemokine receptor (CCR3), a common subunit of interleukin-4 (IL-4) and interleukin-13 (IL-13) receptors, or a common subunit of interleukin-3 (IL-3) receptors. The antisense colony stimulating factor (GM-CSF) receptors. The antisense oligonucleotides can be used in the treatment or prevention of asthma, allergy,

The present invention relates to a new method for assessing the tenderness of meat from an animal. The method involves testing the animal for the presence or absence of a genetic marker, which is an allele of the gene encoding calpastatin or lysyl oxidase, respectively. The method is useful for selecting breeding animals and unpedigreed animals for entry into feed lots. The meat obtained from the selected animals for useful for breeding. The genetic markers are useful for assessing meat tenderness. The genetic markers are useful for assessing meat tenderness. The genetic markers are associated with calpastatin or lysyl oxidase. Calpastatin inhibits calpain activity and is assumed have a rox oxidase initiates cross-link formation at an early stage in collagen fibrillogenesis. The present nucleic acid sequence represents a cow calpastatin (CAST) D/E allele probe of the invention ö unpedigreed animals for entry into feed lots comprises testing the animal for the presence or absence of genetic markers associated with Increasing in vivo efficacy of a nucleic acid molecule that is administered to a mammal for inhibiting inflammation in mammals, involves incorporating into the nucleic acid molecule at least one nucleotide urinary system disease; pathogen infection; genetic disease; cancer; airway; nose; pulmonary fibrosis; adult respiratory distress syndrome; cystic fibrosis; chronic obstructive lung disease; chronic bronchitis; esthma; allergy; allergic rhinitis; sinusitis; hypereosinophilia; cardiant; ophthalmological; cytostatic; antiasthmatic; antiallergic; antinflammatory; immunosuppressive; atopic disease; neoplastic cell proliferation; antisense; IL-4; IL-13; Human; inflammation, 2'6'-diaminopurine; DAP; antisense therapy; DAP-modified oligonucleotide; pulmonary disease; respiratory disease; neurological disease; cardiovascular disease; rheumatological disease; digestive disease; cutaneous disease; ophthalmological disease; Gaps .. The present invention relates to a method for increasing the in vivo efficacy of oligonucleotides and inhibiting inflammation. The oligonucleotides comprise at least one nucleotide substitute of 2'6'-diaminopurine (DAP) and/or its analogue. The DAP nucleotide substitutions are useful for increasing in vivo efficacy of a nucleic acid molecule that is administered to a mammal. The DAP-modified oligonucleotides are useful in antisense therapy for treating and/or preventing cuseful in antisense therapy for treating and/or preventing plantatory diseases, cutaneous of useful in antisense therapy for treating and/or preventing cuseful in antisense therapy for treating and/or preventing cuseful in antisense therapy for treating and/or preventing cuseful in antisense, thematological diseases, digestive diseases, cutaneous cliseases, rheumatological diseases, digestive diseases, cutaneous cliscatory system diseases, general inflammation and cancers. The infections, genetic disease, general inflammation and cancers. The crepitatory system disease is a sickness associated with an inflammation of the lungs, the airways and/or the nose. The respiratory gistem disease is selected from pullmonary fibrosis, adult respiratory distress syndrome, costinophilic bronchitis, asthma, allergy, allergic rhintis, sinusitis and hypereosinophilia. The DAP-modified oligonucleotides are more stable oligonucleotides DAP or its analogues are more effective than other cush addensine. ABX12681 expresent antisense coligonucleotides for treating or preventing atopic diseases and coplesses and c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

The invention relates to a method for kinetically detecting nucleic acid data. The method comprises allowing a target nucleic acid and a probe to bind and form a hybrid, and then detecting for it by kinetic collection of the signal data. The invention also encompasses a device for detecting nucleic acid data. The method of the invention provides for the high speed detection of nucleic acid data, and is capable of detecting a single base difference between nucleic acid sequences. The present sequence represents a human K-Ras codon 12 probe used in an example of
                                                                                                                                                                                                                                                  the invention.

Novel biallelic markers used to construct a high density disequilibrium map of the human genome

Claim 8; Page 2091; 2745pp; English.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ66979 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers of the invention bave a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents acting on a swell as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

Detection and/or genetic analysis of hepatitis B virus - specifically

This sequence represents a probe for the RT pol region of hepatitis by virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (1) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample, and amplifying the concentrating polynucleic acids (1) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample, and amplifying the suitable primer pair; (b) hybridising (1) with a combination of at least 1 support and hybridise specifically to mutant rarget sequences chosen from the HBV RT pol gene region, HBV procore region, HBAB4 region and/or HBV CC genotype specific target sequences, or their complements or U for T compositions; (c) detecting the hybridis formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, c specifically genotype, precore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs, e.g. lamivudune and per pair (1) the correct OS field.) genotype, precore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs. Claim 5; Fig 1; 80pp; English.

0
receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in calls or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepaticis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAV10702-V10719 are primers used in a method to identify the novel human breast cancer gene CHI-9all-2 by differential display. The identified genes or fragments of these genes can be used for identifying genes and gene products that are intimately related to malignant transformation or maintenance of the malignant properties of cancer cells. It can also be used to design or screen diagnostic reagents or therapeutic compounds. Kits are included within the scope of the invention
                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Breast cancer genes - used to develop products to design or screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Breast cancer; malignant transformation; diagnostic; therapeutic; screening; primer; ss.

```
This sequence represents a probe for hepatitis b virus (HBV), used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polymucies acids (1) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample with at least 1 suitable primer pair; (b) hybridishing (1) with a combination of at least 2 nuclecties probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from the HBV RT pol gene region, HBV percore region, HBSAg region and/or HBV genotype specific target sequences, or their complements or U for T homologues; (c) detecting the hybrids formed in
                                                                                                                                                                                                                                                     Probe; hepatitis b virus; HBV detection; RT pol region; genetic analysis; preCore region; HBsAg region; genotype specific target;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   step (b), and inferring the HBV genotype and/or mutants present in the sample from the differential hybridisation signal(s). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, specifically genotype, precore mutations, vaccine escape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mutations and RT gene mutations selected by treatment with drugs, e.g. lamivudune and penciclovir. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection and/or genetic analysis of hepatitis B virus - specifically genotype, preCore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

The present invention relates to hepatitis B virus (HBV) strain FRI, genotype G DNA encoding PreCore/Core protein, HBpol, envelope (PreSI, PreSI and surface antigen HBsAg) and HBX proteins. HBV genotype G nucleic acids and polypeptides are useful for diagnosing, prognosing and treating infections caused by HBV genotype G. They can be used in a vaccine to creat or prevent HBV genotype G infection. The HBV genotype G derived nucleic acids and antibodies are useful for detecting HBV genotype G in a sample or diagnosis of HBV genotype G infection. The presence of HBV can diagnosis of HBV genotype G infection. The presence of HBV can down liver ancer in the subject. The HBV genotype G core insert peptide encoding nucleic acid is useful for designing monitoring assays and HBSAg (genotype G antibodies and HBSAg (genotype G antibodies) and HBSAg (genotype G antibodies) in patients infected with HBV. The antibodies or antigens of HBV genotype G. The present sequence is a PCR primer used to amplify hepatitis B virus (HBV) genotype G DNA

The invention relates to the complete nucleic acid sequence of a new human hepatitis B virus (HBV) genotype, provisionally named genotype G. This genotype was found with a high prevalence in patients chronically infected with HBV and residing in Burope and the USA. The invention relates to a fully defined sequence of 3248 nucleotides as given in sepoilication, a sequence with 92% identity to the given sequence, or sequence that is degenerate to the mentioned sequences. These polynucleotides are useful for HBV genotyping. The proteins encoded by the polynucleotides are useful for detecting antibodies in a biological sample. Ligands that bind to the proteins and for detecting the proteins are useful for detecting the proteins and for detecting the proteins and HBAG (precore precursor proteins). They are also useful for preparing a vaccine or medicament for treating HBV infections. The present sequence is one of a number of primers used to amplify HBV DNA in examples demonstrating HBV genotyping and the detection of HBV genotype G

replication, infectivity or gene expression of a hepatitis C virus (HCV) directed to target sequences AAA1348 to AAA1344, AAA13454 and AAA13465.

(I) have virucide, hepatotropic and antiinflammatory activities. (I), or vectors comprising nucleotide sequences encoding (I), are useful for interfering with the replication or gene expression of HCV in a human cells. (I) are useful for diagnosis, prevention and treatment of HCV in fection or disease in a mammals especially humans. Nucleotide sequences encoding (I) are useful for preventing hepatitis C viral infection in a cells. (I) are useful for preventing hepatitis C viral infection in a cells. (I) are useful for preventing hepatitis C viral infection in a cells. (I) are useful to preventing hepatitis C viral infection in a cells. (I) are useful to prevent examples of the briefest requirements for hairpin ribozyme; AAA13405 represent HCV capsid sequence; AAA13408 to AAA13467 represent HCV hairpin ribozyme recognition sites; and AAA13408 to AAA13473 represent oligonucleotides used in the construction of HCV hairpin ribozymes, all these sequences are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hairpin ribozyme; ss; hepatitis C infection; HCV; gene therapy; virucide; PCR; primer; RT-PCR; reverse transcriptase PCR.
                                                                                                                                                                                                                                                                             The present invention describes ribozymes (I) capable of inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New ribozyme having the ability to inhibit replication, infectivity or
                                                                                                                                                                    Ribozyme capable of inhibiting replication, infectivity or gene expression of hepatitis C virus, useful for treating or preventing hepatitis C virus infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primers AAT90589-90 were used to amplify reverse transcribed RNA containing the 5' untranslated region (5' UTR) and the capsid coding containing the 5' untranslated region (5' UTR) and the capsid coding cregion of the Hapatitis C virus (HCW). The PCR product is used to generate a reporter plasmid which contains the HCV 5'-capsid sequence upstream of the E. coli lacZ gene, and a neomyoin resistance cassette. This plasmid, together with a plasmid expressing a HCV hairpin ribozyme are used to co-transfect the hepatocellular carcinoma cell line Huh7 and G418-resistant transformants selected. Under normal conditions, the ribozyme expressed will inhibit expression of lacZ, but if the cells are contcated with a sample containing HCV, then the 5'-untranslated region produced by the virus will interfere with the ribozyme, allowing expression of lacZ which can be detected colorimetrically. The ribozymes, when optionally expressed from a vector, cleave the RNA of HCV and so are useful for treatment and prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genome, useful
behavioral traits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAAG6139 to AAAG6242. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 of the dog genome and provides a dense map integrating different types of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify
                                                                                                 The invention relates to a new ribozyme with the ability to inhibit replication, infectivity or gene expression of a Hepatitis C Virus (HCV) by cleaving the positive strand genomic RNA of HCV at a sequence having 16 bp. Also included are a mucleic acid encoding the ribozyme, a host coll containing the ribozyme or vector, a vector comprising a promoter operably linked to the mucleic acid, producing a ribozyme, interfering with HCV or a composition comprising the ribozyme and a carrier culture with HCV or a composition comprising the ribozyme and a carrier or diluter. The ribozyme is useful for treating or preventing HCV infection. The present sequence is a reverse transcriptase (RT)-PCR primer used to amplify HCV coding regions for cloning into expression
                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Dog; genome; genomic marker; radiation hybrid map; identification; chromosome location; gene marker; polymorphic microsatellite marker; phenotype; behaviour; pedigree; ss.
gene expression of a Hepatitis C Virus (HCV), useful for treating or preventing HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention describes a new polynucleotide comprises a polynucleotide:

(a) having any of 101 nucleic acid sequences with 18-19 bp fully defined in the specification; (b) encoding any of seven polypeptides having 7 amino acids, or a polypeptide with 3 amino acids; (c) capable of hybridising to a polypeptide with a amino acids; (d) capable of encoding a molecular CYP2C8 variant polypeptide or its fragment. The polynucleotide, gene, vector, polypeptide or antibody is useful for diagnosing or treating a disease, for preparing a diagnostic composition for treating a disease, or for preparing a parmaceutical composition for treating a disease. This sequence represents a primer used to isolate regions of the human cytochrome P450 polypetide 28 gene (CYP2C8) in order to identify the single nucleotide polymorphism (SNP) in that region of different individuals useful in disease diagnosis
                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polymorphic variants of the gene encoding Cytochrome P450 polypeptide 2C8 (CYP2C8), useful for diagnosing or treating a disease, e.g. arachidonic acid metabolism, cancer or cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytochrome P450 polypeptide 2C8; CYP2C8; arachidonic acid metabolism; cancer; cardiovascular disease; cytostatic; cardiovascular; gene therapy; single nucleotide polymorphism detection; SNP detection; PCR; primer; ss.
morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes

The invention relates to a HERG protein having a mutation compared to wild-type HERG, and is useful for developing products for the diagnosis, prevention and treatment of long QT (LQT) syndrome. The products and methods can be used for the diagnosis of subjects with LQT syndrome. They can also be used to screen for drugs for treating or preventing LQT syndrome. The HERG nucleic acids can also be used for gene therapy and HERG peptides can be used for peptide therapy. Sequences AAAO7654-693
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ss; PARP; Poly (ADP-ribose) polymerase; antisense oligonucleotide; cytostatic; nootropic, neuroprotective; antiinflammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; ischaemia; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated mutant HERG nucleic acids, useful for developing products for the diagnosis, prevention and treatment of long QT syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a new polynucleotide comprises a polynucleotide:

(a) having any of 101 nucleic acid sequences with 18-19 bp fully defined

to the specification; (b) encoding any of seven polypeptides having 7

amino acids, or a polypeptide with 3 amino acids; (c) capable of

hybridising to a Cyrochrome P450 polypeptide 2C8 (CYP2C8) gene; (d)

choching a molecular CYP2C8 variant polypeptide or its fragment. The

polynucleotide, gene, vector, polypeptide or antibody is useful for

diagnosing or treating a disease, for preparing a diagnostic composition

for diagnosing a disease, or for preparing a pharmaceutical composition

for treating a disease. This disease includes arachidonic acid

metabolism, cancer or cardiovascular diseases. This sequence represents a

composition of primer used to isolate regions of the human cytochrome P450 polypetide

CCB gene (CYP2C8) in order to identify the single nucleotide polymorphism

CNPPCRB in that region of different individuals useful in disease diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                       Cytochrome P450 polypeptide 2C8; CYP2C8; arachidonic acid metabolism; cancer; cardiovascular disease; cytostatic; cardiovascular; gene therapy; single nucleotide polymorphism detection; SNP detection; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polymorphic variants of the gene encoding Cytochrome P450 polypeptide 2C8 (CYP2C8), useful for diagnosing or treating a disease, e.g. arachidonic acid metabolism, cancer or cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The patent discloses a method of screening mammals for autoimmune diseases by identifying polymorphisms in interleukin (IL)-12 p40 gene. The methods and kits of the invention are used for screening individuals, families and populations for disease conditions or predispositions for the development of a disease condition which is characterised, exacerbated or associated with Th1/Th2 dysregulation in a mammal. They are used to treat, prevent or disponse autoimmune diseases such as IDDM (Insulin dependant diabetes mellitus). The present DNA sequence is a PCR primer which is used to detect polymorphism in mammalian IL-12 p40 intron
                                                                                                                                                                                                                                                                                                                  Screening mammals for autoimmune diseases such as diabetes, comprises identifying polymorphisms in interleukin (IL)-12 p40.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primer #1, to detect polymorphism in mammalian IL-12 p40 intron 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Interleukin-12; IL-12 p40; autoimmune disease; Th1/Th2 dysregulation; therapy; Taq1+ allelic variant; insulin dependant diabetes mellitus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to antisense oligomucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligomucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human disease associated with PARP especially hyperproliferative human disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primer #5, to detect polymorphism in mammalian IL-12 p40 intron 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Interleukin-12; IL-12 p40; autoimmune disease; Th1/Th2 dysregulation;

The patent discloses a method of screening mammals for autoimmune diseases by identifying polymorphisms in interleukin (II)-12 p40 gene. The methods and kits of the invention are used for screening individuals, families and populations for disease conditions or predispositions for the development of a disease condition which is characterised, exacerbated or associated with Th1/Th2 dysregulation in a mammal. They are used to treat, prevent or diagnose autoimmune diseases such as IDDM (Insulin dependant diabetes mellitus). The present DNA sequence is a PCR primer which is used to detect polymorphism in mammalian IL-12 p40 intron
Screening mammals for autoimmune diseases such as diabetes, comprises identifying polymorphisms in interleukin (IL)-12 p40.
                                                                                                                                                                                        Example 6; Page 41; 115pp; English.

Screening mammals for autoimmune diseases such as diabetes, comprises identifying polymorphisms in interleukin (IL)-12 p40.

Example 6; Page 41; 115pp; English.

diseases by identifying motorphisms in interleukin (II) all dentifying motorphisms in interleukin (II) all dentifying motorphisms in interleukin (II) all dentifying polymorphisms in interleukin (II) all dentifications for the inventions or predispositions for the development of a disease condition which is characterised.

Exactrated or associated with Til/Th2 dysregulation in a mammal. They are used to treat, prevent or diagnose autoimmune diseases such as IDDM (Insulin dependant diabetes mellitus). The present DNA sequence is a PCR primer which is used to detect polymorphism in mammalian IL-12 p40 intron discloses a method of screening mammals for autoimmune patent 

```
The inventor relates to an isolated Fanconi anaemia protein complex complex.

(FANCD2) polypeptide. The FANCD2 protein comprises a sequence of 1472 amino acids fully defined in the specification, its 90% identical sequence, a sequence encoded by a polymotlectide that is at least 90% identical to sequence succeed by a polymotlectide that is at least 90% identical to sequence succeed in specification such as a 5127 base pair sequence, or a fragment which is at least 50 amino acids in length. The SANCD2 protein is useful for treating an FA pathway defect in a cell target or for treating a patient with a defective FANCD2 gene. The FANCD2 gene is useful for making a recombinant expression vector. The FANCD2 concept and in diagnostic test and screening assays for diseases associated with DNA repair and cell cycle abnormalities such as Fanconi cancer, and in diagnostic test and screening assays for diseases associated with DNA repair and cell cycle abnormalities such as Fanconi cancer, ataxia telangicctasia and Xeroderna pigmentosum. The FANCD2 gene is useful in producing probes and primers for screening patients in genetic based test, for diagnosing Fanconi anaemia and cancer, for genetic based test, for diagnosing Fanconi anaemia and cancer, in gene therapy methods. A recombinant vector containing the FANCD2 gene in gene therapy methods. A recombinant vector containing to the represents a PCR primer for amplifying a FANCD experience.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated Fanconi anemia protein complex polypeptide, termed FANCD2, useful for treating Fanconi anemia pathway defect in cell target or for treating patient with defective FANCD2 gene.

The polypeptide can be expressed by standard recombinant methodology. The PDE7a3 splice variant polypeptides and polymocleotides are useful for treating cardiovascular diseases, asthma, allergy, inflammatory diseases, fertility disorders and transgenic animals, which include knock-in animals (in which an animal transgenic animals, which include knock-in animals (in which an animal useful in drug discovery process, for target validation. The PDE7a3 splice variant polypeptides and polymucleotides are useful as vaccines for inducing an immunological response in a mammal. Sequences ABL568392-93 represent PCR primers used to verify the existence of the novel PDE7a3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /*tag= a

Detecting cancer involving or compare and constitution of the cancer is specification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAI gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using e.g. a scanning presence or absence of the target nucleotide sequences. ABI82074 to ABI87546 represent oligonucleotide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method (M1) for designing capture oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (I) will hybridise with little mismatch, where for detecting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmoncala, Listerial monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus necformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                         ligase detection reaction, LDR; p53; BRCAI, BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome, obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.

                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes novel human proteins designated NOVX (where X is 1, 2a, 2b, 2c, 2d, 3, 4, 5, 6a, 6b, 7, 8, or 9). NOV1 is a tyrosine-protein kinase 6-like protein; NOV4 is a cystatin 8-like protein; NOV4 is a cystatin B-like protein; NOV4 is a cystatin B-like protein; NOV5 is a serotomin receptor-like protein; NOV6 and NOV65 vare protein; NOV9 is a matrilin-2-like protein; NOV9 is a matrilin-2-like protein; NOV9 is a protein; and inducible glycoprotein 30-like protein; NOV7 is a matrilin-2-like protein; NOV9 is a tyrosine kinase-like protein. NOV7 sequences have cytostatic, antiarteriosclerotic, cardiovascular, antidiabetic, immunosuppressive and neuroprotective activities, and can be used in gene therapy. The NOV7 sequences can be used in therapeutics, particularly for treating, preventing or alleviating a NOVX-associated disorder or a pathological state in a subject, particularly a human. These disorders include cardiomyopathy, atherosclerosis, a disorder related to cell signal processing and metabolic pathway modulation or diabetes. The NOVX
                                                                                                                                                                                                                                                                                                                                                    Human; NOVX; cytostatic; antiarteriosclerotic; cardiovascular; lymphoma; antidiabetic; immunosuppressive; neuroprotective; gene therapy; cancer; cardiomyopathy; atherosclerosis; cell signal processing; diabetes; AIDS; metabolic pathway modulation; neoplastic; neurological disorder; asthma; adenocarcinoma; prostate cancer; uterus cancer; immune response; crohn's disease; multiple sclerosis; Graft versus host disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Alsobrook JP, Lepley DM, Burgess CE, Mishra V;

            predisposition to a disease associated with altered levels of NOVX predisposition to a disease associated with altered levels of NOVX polypeptide or muchaic acid, particularly cancer. The NOVX sequences are sepecially useful in therapeutic or prophylactic applications for neoplastic or neurological disorders, and in the treatment of adenocarcinoma, lymphoma, prostate cancer, uterus cancer, immune response, AIDS, asthma, Crohn's disease, multiple sclerosis or Graft versus host disease. The present sequence repersents a PCR primer for human NOV7, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse, antisense, phospholipid scramblase I; immune disorder; cancer; inflammation; hyperproliferative; antisense therapy; phosphorothioate;

The invention relates to a novel method of diagnosing or determining if a patient has cancer or is at increased risk of cancer, involving testing a fanconi Anaemia (FA)/BRCA pathway gene or protein for the presence of a cancer-associated defect, where the presence of one or more cancer-associated defects is indicative of cancer or an increased risk of cancer in the patient. The method of the invention has cytostatic activity. The method is useful for determining if a patient has cancer, or is at cancer, or or set in cancer. A microarray of the invention is useful for determining if a patient has cancer, or is at increased risk of developing cancer, by hybridising a nucleic acid sample to the nucleic acid sequences from the patient who detecting the presence of mutations is indicative of a patient, where detecting the presence of mutations is indicative of a patient who has cancer, or is at increased risk of developing cancer. A method of the invention is useful for screening a chemosensitising agent, and the agent obtained is useful for treating a patient having a cancer. The present sequence is useful for the exemplification of the invention.
                                                                                                      Diagnosing or determining cancer or increased risk of cancer in a patient, by testing Fanconi Anemia/BRCA pathway gene or protein for a cancer-associated defect, that indicates cancer or increased risk of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an antisense compound targetted to a nucleic acid molecule encoding phospholipid scramblase I and which specifically hybridises with and inhibits the expression of phospholipid scramblase I, or which hybridises with at least an 8 nucleobase portion of an active site on a nucleic acid molecule encoding phospholipid scramblase I. The invention is useful for inhibiting the expression of human phospholipid scramblase I in cells or tissues and for treating an animal having a disease or condition associated with phospholipid scramblase I, such as inflammation, an immune disorder and a hyperproliferative condition, e.g. cancer. The invention is useful for diagnostics, therapeutics and as research reagent. The present sequence is mouse phospholipid scramblase I
                                                                                                                                                                                                                                                                                                                                                                  Novel antisense compounds targeted to nucleic acids encoding phospholipid scramblase I, for modulating gene expression and treating inflammation, immune disorders and hyperproliferative conditions e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ·

The present sequence was used to isolate clones containing the 3' end of the Atr-2 coding sequence. Atr-2 is a member of the phosphatidylinositol kinase (FIK)-related family of kinases, which are involved in cell cycle checkpoints and DNA damage repair. The Atr-2 polypeptide, antibodies against Atr-2, and modulators of Atr-2 activity are used to modulate disease states associated with Atr-2 expression and/or biological activity. Aberrant Atr-2 activity is associated with forms of cancer, e.g. metastatic cancer, locally advanced tumours, breast cancer, small cell carcinomas, intrinsic brain tumours and bone cancers. The anti-Atr-2 antibodies can be used as detecting agents to detect or quantitate Atr-2
be used for reliable assessment of drug resistance with the recombinant HIV-1. AAZ21352 to AAZ21392 represent primers used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel Atr-2 polypeptide and polynucleotide are used for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diseases associated with aberrant Atr-2 activity in different forms of cancer e.g. metastatic cancer, locally advanced tumors and bone cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a recombinant human immunodeficiency type I virus (HIV-1) having a variation in the predetermined base in the region encoding for viral protease in comparison to HIV genome gene cloned in HIV-1 molecular clone pNL4-3, and having a (+) chain RNA genome with modifications of A at 2591st gene of the HIV genome into C, and A at 2594th into G, and a modified amino acid sequence corresponding to modified base in the region encoding for the virus derived protease, and optionally having a recombinant HIV-1 molecular clone with a plasmid composed of the same base sequence with that of the molecular clone pNL4-3 in the residual base sequence. Also described are: (1) the plasmid of plasmid pNL-321,461 84V for the recombinant HIV-1 molecular clones can pNL-8ma2 and pNL-delta-Pro2. The recombinant HIV-1 molecular clones can
                                                                                                                                                                                                Oligonucleotides which are complementary to part of the hepatitis C virus
                                                                      Anti:sense oligo:nucleotide(s) complementary to hepatitis C viral genome - useful for inhibiting HCV replication, to treat related diseases.
                                                                                                                                                                                                                     genomic or messenger RNA are claimed. Preferred antisense objective (see Ap5884-058887) are complementary to RNA comprising the 5'end hairpin loop, 5'end 6bp repeat, 5'end untranslated region, polyprotein translation initiation codon, ORF3 translation initiation codon, 3' untranslated region, 3'end palindrome region, R2 sequence or 3' end hairpin loop of HCV. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant human immunodeficiency type 1 virus - useful for assessment

The present invention relates to antisense molecules targeted to polynucleotide sequences encoding calcium-independent receptor alphatatrocoxin (CIRL). The antisense molecule specifically Mybridises with the polynucleotide sequence encoding CIRL and inhibits the expression of CIRL. Also disclosed is a method for inhibiting the expression of CIRL in man calls or tissues in vitro. The antisense oligonacleotides and method of the invention are useful for treating ischaemic stroke. The antisense oligonacleotide enters hippocampal cells and binds specifically to the polynucleotide sequence encoding CIRL. The oligonacleotide blocks neurodegeneration of hippocampal neuron cells caused by ischaemia and it comprises at least one modified internucleoside linkage. The modified internucleoside linkage. The present internucleoside linkage is a phosphorothicate linkage. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotide targeted to a nucleic acid molecule encoding a calcium-independent receptor for alpha-latrotoxin, useful for treating ischemic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence represents a reverse transcription (RT)-PCR primer used to analyse mRNA expression levels of CIRL in rat CA1 and CA3 neurons.
                                                                                                                                                                            Antisense; calcium-independent receptor alpha-latrotoxin-3; CIRL-3; CIRL expression; ischaemic stroke; hippocampal neuron cell; neurodegeneration; vasotropic; cerebroprotective; rat; CAl neuron; CA3 neuron; reverse transcription-PCR; RT-PCR; primer; ss.

The present sequence is that of PCR primer rfbE-a, which corresponds to nucleotides 673-693 of the rfbE gene of Escherichia coli. It is used with primer rfbE-b ADE86665 to amplify a 327 bp portrion of the gene. The cinvention provides a single kit comprising 3 multiplex PCR assays that can detect in E. coli the presence of the 8 virulence genes: each, EHEC-CR HIVA, Stx1 (VT1), Stx2 (VT2), Stx2d (VT2d), Stx2d (VT2d), Stx2e (VT2e) and Stxf (VT2f). The kit can also detect the 2 critical serotypes (0157 and H7) and identify the species (E. coli) simultaneously using a one-step reaction. The kit comprises 11 primer pairs ADE86048-ADE86069. It is useful for detecting E. coli serotype 0157 H7 particularly in faccal, especially environmental samples of drinking or recreational water, and code samples of ground beef, apple juice, milk, salami, alfalfa sprouts and lettuce. The primers are designed to target the coding regions of genes and to avoid areas of homology within the structural genes for the companies of the structural genes for the control all sets were tested from a positive reference E. coli strain cand used as a template in a standard PCR reaction using the primer sets. CCR control all sets were tested with E. coli strain ATCC 259222 in which control 165 stream and primer lesure tested and none showed specific PCR amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length
                                                                                                                                                                                                                                                                                                                                                The sequences given in AAQ61990-2001 are oligonucleotides which contain 64 or 63 stretches and which may be used for inhibiting replication of therpes simplex virus (HSV), activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper- proliferation, as these, may be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human cytomegalovirus; influenza virus; inflammation;

These oligos pref. hybridise with a translation initiation site, a coding compositions for the treatment and diagnossis of herpes viral infection, by contacting the virus or the animal, or its cells, tissues or body fluids with the oligo. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                               New oligonucleotide(s) hybridising with DNA or RNA of herpesvirus gene are used in the treatment and diagnosis of herpes simplex virus, cytomegalovirus, Epstein Barr virus and varicella zoster infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibition; replication; herpes simplex virus; HSV; HIV; retard; human cytomegalovirus; influenza virus; inflammation; telomere length; neurological disorders; phospholipase A2 activity; hyperproliferation; malignancy; cardiovascular disease; snake bite; malignancy; aging; ss.

                                                                                                             The sequences given in AAQ61825-50 and AAQ61886-906 are oligomucleotides which contain a G4 or two G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV). Oligomucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                    New modified oligo-nucleotide contg guanine guartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New modified oligo-nucleotide contg guanine quartet - inhibits activity

                                                                                                                                                                                     The sequences given in AAQ61913-16 are oligonucleotides which contain a d4 stretch and which may be used for inhibiting replication of human immunodeficiency virus (HIV). Oligonucleotides such as these may also be used for inhibiting activity of HSV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper-proliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN
e.g. HIV, and phospholipase A2 and modulates telomere length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oligomer hybridisable to HIV sequence and contg. peptide nucleic acid sub:unit - binds in complementary manner to DNA and RNA, and useful for modulating HIV viral activity, e.g. in treating AIDS.

of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation AUG region, 5' untranslated region (3' UTR), splice untranslated region (5' UTR), 3' untranslated region (3' UTR), splice junctions or coding sequence of a human immunodeficiency virus gene chosen from env, gag, pol, rev and tat. The PNAs can be used to traget chosen from moieties They have utility as gene-targetted drugs for modulating HIV processes. Hence they can be used to treat AIDS and other viral infections. They are also useful in diagnostic applications and as research tools. PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the first PNA strand binds with the first PNA strand binds with the first PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates cellular uptake. Further, since they contain amides of non-biological amino acids, they present sequence is a specifically claimed PNA sequence (represented by the sequence of nucleobases) targetting HIV genes. (Updated on 25-MAR-2003 to correct PN field.) are provided which (a) consist New peptide nucleic acid (PNA) oligomers

RIBOZYME PHARM INC. (RIBO-)

Chowrira BM; Mcswiggen J, 'n Blatt

WPI; 2001-607195/69.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 79; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a neurite growth inhibitor grows of a crops gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor grows or a mucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a numberzyme (an endolytic nucleic acid cleaving RNA with a NRN motif) proposessing an NRH motify RNA with a NRN motify a numberzyme (cleaving RNA with a NRN motify a condition associated or cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+.

Furthermore, it may be contacted with a coll to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of fone or more theodyfair's lymphocytical NRH, bulky low-grade or follicular NHL, lymphocytic lymphoma, leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (NCL), immunocytoma (NHC), small B-cell lymphocytic lymphoma, immunodeficiency virus) associated NHL, mantle-cell lymphoma (NCL), immunocytoma (HMC), small B-cell lymphocytic lymphoma, clamphoma (NCL), immunocytoma (HMC), small B-cell lymphocytic lymphoma (NCL), immunocytoma (HMC), small B-cell lymphocytic lymphoma (NCL), immunocytoma (HMC), small B-cell lymphocytic lymphoma (NCC) targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the presence of a divalent cation that is preferably Mg^2+. Furthermore, the coll and treat a patient having a condition associated with the level of theraphes. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, demential muscular dystrophy, and/o sequence is an inozyme of the invention

The invention relates to a method of identifying a mammalian twisted gastrulation (Tsg) 101 peptide. The method involves measuring the level of human immunodeficiency virus (HIV) viral particles released in a culture of mammalian cells having an expression construct comprising a portion of the coding sequence of a mammalian Tsg101 gene and comparing the level of HIV viral particles to that in a culture of control mammalian cells. The method is useful in identifying a peptide that is effective in reducing HIV particle production or which may be used in treating a patient infected with HIV or other retrovirus. The invention is useful in gene therapy and peptide therapy. The present sequence is a PCR primer used to construct Pr5SGag and pl-p6 hybrid for expression in yeast. This primer is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNB. The nucleic acid molecules include antisense and enzymetic nucleic acids such as hammerhead ribozymes. DNAzymes, and Enzymes, DNAzymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed transcriptiase and/or HBV reverse transcriptiase primer sequences, as well as oligonuclectides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV cribozyme, inozyme, inozyme, zinzyme, DNAzyme or amberzyme sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          o'
hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic;

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DASZYMES, CASZYMES, CASZYMES, DASZYMES, CASZYMES, DASZYMES, DASZYMES, CASZYMES, DASZYMES, DASZYMES, CASZYMES, DASZYMES, DASZYME, GALDAZYME, DASZYME, DASZYME, DASZYME, DASZZYME, SCIENCY, ZINZYME, DASZZYME SEQUENCES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                       Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleic acid polymerase; enzyme; Thermus scotoductus; DNA polymerase; salt tolerance; thermostability; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention describes isolated nucleic acids encoding nucleic acid polymerases from Thermus scotoductus. Also described: (1) an isolated nucleic acid (1) encoding a nucleic acid polymerase from Thermus scotoductus strain X-1, ATCC Deposit No. 27978; (2) an isolated DNA polymerase polypeptide from Thermus scotoductus strain X-1, ATCC Deposit No. 27978; (3) an isolated nucleic acid polymerase; (4) an isolated nucleic acid polymerase; (4) an isolated nucleic acid polymerase comprising any of a set of 16 amino acid sequences (81, see ADA504545 to ADA50456) which encodes a nucleic acid polymerase comprising any of a set of 16 amino acid sequences (82, see ADA50389 to ADA50404); (5) isolated nucleic acid polymerase comprising any of a set of 16 amino acid sequences (1), (11), or (111), and especially expression vectors in which the nucleic acid polymerase gene is operably linked to a promoter; (7) a host cell comprising an isolated nucleic acid molecule encoding a nucleic acid polymerase gene is operably linked to a promoter; (7) a host cell comprising an isolated nucleic acid polymerase from Thermus scotoductus strain X-1, ATCC Deposit No. 27978; (8) a host cell comprising (1) or (11); (9) a kit comprising a nucleic acid polymerase comprising any of amino acid sequences S2 by incubating any of amino acid sequences S2 by incubating any of amino acid sequences S2 with a DNA under conditions sufficient for permit DNA polymerase prepared by M1; (12) synthesising DNA (M2) comprising contacting a polypeptide comprising any of amino acid sequences S2 with a DNA under conditions sufficient to permit DNA polymerases by incubating and conditions of nucleic acid under conditions better salt comprising any of amino acid sequences S2 with a DNA under conditions conditions better show the present sequencing in proved sequence or varying degrees of thermocyalist acid polymerases prepared by Thermocyalist and DNA sequencing. The present sequence represents and in an example from the present invention.
                                                                                                                                                               New nucleic acid encoding a Thermus scotoductus strain X-1, ATCC Deposit No. 27978 nucleic acid polymerase, useful for producing nucleic acid polymerases having e.g., improved sequence discrimination or better salt
                                                                                                                                                                                                                                                                                                          Example 1; Page 79; 179pp; English.

(3); (5) The present invention describes a nucleic acid (I) encoding a nucleic acid polymerase or a derivative nucleic acid polymerase with a mutation that decreases 5.3' exonuclease activity or that reduces discrimination against dideoxymucleotide triphosphates. Also described: (I) a vector comprising the nucleic acid (I); (2) a host cell comprising the nucleic acid polymerase or its derivatives; (4) a kit comprising a container containing the nucleic acid polymerase of (3); (6) synthesising a DNA; (7) making the nucleic acid polymerase of (3); (6) synthesising a DNA; (7) thermocyclic amplification of nucleic acid, and (8) primer extending a DNA. The nucleic acid (1) is useful for DNA sequencing or amplification, reverse transcription, RNA amplification or primer extension reactions. for Thermus oshimai nucleic acid polymerase, which is used in an example from the present invention New nucleic acid, useful for DNA sequencing or amplification, r transcription, RNA amplification or primer extension reactions. ```
New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length of chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAQ61990-2001 are oligonucleotides which contain G4 or G3 stretches and which may be used for inhibiting replication of herpes simplex.virus (HSV), activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders
                                                                                        The sequences given in AAQ7325-81 represent oligonucleotides which hybridise specifically with DNA or RNA from a herpes virus gene corresponding to one of the open reading frames ULS, -8, -9, -20, -27, 29, -30, -42, -52 or IE175 of herpes simplex virus type I (HSV-1). These oligos pref. hybridise with a translation initiation site, a coding region or a 5' untranslated region. These oligos may be used in compositions for the treatment and diagnosis of herpes viral infection, by contacting the virus or the animal, or its cells, tissues or body fluids with the oligo. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibition, replication, herpes simplex virus; HSV; HIV; retard; human cytomegalovirus; influenza virus; influenza virus; influenze telepth; neurological disorders; phospholipase Activity; hyperproliferation; malignancy; cardiovascular disease; snake bite; malignancy; aging; ss.

                                                                                                                                                                          free invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, cantifering quantifying and/or amplifying nucleic acids, as in vitro sense and antisens sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies or viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, the containing the vectors of the nucleotides and polypeptides can also be used to screen for their specific interactive molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligonucleotide(s) hybridising with DNA or RNA of herpesvirus gene are used in the treatment and diagnosis of herpes simplex virus,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAQ61825-50 and AAQ61886-906 are oligonucleotides which contain a G4 or two G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
caused by phospholipase A2 activity in cases of hyper- proliferation, malignancy, cardiovascular disease and snake bite. Oligonucleotides such as these, may be used for inhibiting division of malignant calls by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAQ61913-16 are oligonucleotides which contain a d4 stretch and which may be used for inhibiting replication of human immunodeficiency virus (HIV). Oligonucleotides such as these may also be used for inhibiting activity of HSV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper- proliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length

Oligomer hybridisable to HIV sequence and contg. peptide nucleic acid sub:unit - binds in complementary manner to DNA and RNA, and useful for modulating HIV viral activity, e.g. in treating AIDS.

Claim 2; Page 176; 186pp; English.

backbone and (b) hybridise to the translation initiation AUG region, 5' untranslated region (5' UTR), 3' untranslated region (1' UTR), splice intringing sequence of a human immunodeficiency virus gene consent from env, gag, pol, rev and tat. The PNAs can be used to target chosen from env, gag, pol, rev and tat. The PNAs can be used to target standard DNA (85DNA) to produce antisense type gene regulation moieties. They have utility as gene-targetted drugs for modulating HIV processes. Hence they can be used to treat AIDS and other viral infections. They are also useful in diagnostic applications and as research tools. PNA oligomers have high affinity for complementary single creamed DNA. They are also able to form triple helices in which a first PNA strand binds with the first PNA strand binds with the creating double helix or with the first PNA strand binds with the significant charge and are water soluble, which facilitates cellular cubtake. Further, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases.

The present sequence is a specifically claimed PNA sequence (represented by the sequence of nucleobases) targetting HIV genes. (Updated on 25-MAR-New peptide nucleic acid (PNA) oligomers are provided which (a) consist

useful for diagnosing, treating prognosticating and/or monitoring lung cell proliferative disorders e.g. adenocarcinoma and squamous cell genomic Detecting and differentiating cytosine methylation state of 

Claim 15; SEQ ID NO 657; 58pp; English.

This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with at least one gene and/or their regulatory teargons. Specifically, it refers to a method comprising contacting a target mucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated CpG dinucleotides present in the target DNA. As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma differentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and pNA-oligomers that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPS) of the target sequence. This oligomerolide sequence is a primer oligomer used for the analysis of CpG positions within genomic DNA, used in an exemplification of the

This sequence represents a primer used in the analysis of a fragment of the bovine viral diarrhea virus (BVDV) genome. The primer is used to illustrate the nucleic acid analysis methods of the invention. The methods are used for sequencing a nucleic acid in a mixture comprising two nucleic acid target sequences. The methods are used for simultaneously naalysing multiple nucleic acid regions in a single reaction. This can allow the reliable diagnosis and differentiation of pathological organisms. The methods can be adapted to use a series of primers with additional sequences which allows the size of the amplified region to be increased. The technique is especially useful when the usual sequence of the region to be detected is known and the assay is being carried out to confirm its presence e.g. to rule out a falsely positive amplification reaction or to distinguish subsets of an organism of interest or allelic forms of a gene associated with a disease or predisposition to a disease. (Updated on 15-SBP-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 14.4; DB 1; Length 19;

                                                            hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                        designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA867415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                    New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a hairpin or hammerhead ribozyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar;

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, cepthalmological, cytostatic, antiseborrheic, antidiabetic, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, cleaves contains or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn is an inflammation. Adhisory or a sequences used in the
                                                                                                                                                                                                                                                                                                                       Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 19 BP; 0 A; 7 C; 4 G; 8 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                           Example 1; Page 309; 408pp; English.

```
The invention describes a new polynucleotide comprises a polynucleotide:

(a) having any of 101 nucleic acid sequences with 18-19 bp fully defined in the specification; (b) encoding any of seven polypeptides having 7 amino acids, or a polypeptide with 3 amino acids; (c) capable of hybridising to a Cytochrome P450 polypeptide 2C8 (CYP2C8) gene; (d) encoding a molecular CYP2C8 variant polypeptide or its fragment. The polynucleotide, gene, vector, polypeptide or antibody is useful for diagnosing a disease, or for preparing a diagnostic composition for treating a disease. This disease includes arachidonic acid metabolism, cancer or cardiovascular diseases. This sequence represents a primer used to isolate regions of the human cytochrome P450 polypetide primer used (CYP2C8) in order to identify the single nucleotide polymorphism (SNP) in that region of different individuals useful in disease diagnosis
                                                                                                                                                           New polymorphic variants of the gene encoding Cytochrome P450 polypeptide 2C8 (CYP2C8), useful for diagnosing or treating a disease, e.g. arachidonic acid metabolism, cancer or cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 19 BP; 3 A; 6 C; 3 G; 6 T; 0 U; 1 Other;

New polymorphic variants of the gene encoding Cytochrome P450 polypeptide 2C8 (CYP2C8), useful for diagnosing or treating a disease, e.g. arachidonic acid metabolism, cancer or cardiovascular diseases.

Ξ

schultz451-1.rng

```
The invention describes a new polynucleotide comprises a polynucleotide:

(a) having any of 101 nucleic acid sequences with 18-19 bp fully defined in the specification; (b) encoding any of seven polypeptides having 7 amino acids, or a polypeptide any of seven polypeptides having 7 amino acids, or a polypeptide with 3 amino acids; (c) capable of hybridising to a Cytochrome P450 polypeptide or its fragment. The pencoding a molecular CYP2CB variant polypeptide or its fragment. The polynucleotide, gene, vector, polypeptide or antibody is useful for diagnosing a disease, for preparing a diagnostic composition for treating a disease. This disease includes arachidonic acid metabolism, cancer or cardiovascular diseases. This sequence represents a primer used to isolate regions of the human cytochrome P450 polypetide 2C8 gene (CYP2C8) in order to indentify the single nucleotide polymorphism (SNP) in that region of different individuals useful in disease diagnosis
                                                                                                                                                                                                                                                                                                                     0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This primer is used in the nested PCR amplification of the DNA base sequences isolated from a retrovirus particle collected from the blood of an AIDS patient. The specification provides DNA base sequences encoding a retroviral protein which reacts with serum of AIDS patients. It provides an antigen for the detection of an antibody against retrovirus which provides are the detection of an antibody against retrovirus which provides a method for antigen measurement in which the above antigen is contacted with a sample blood to determine immunoglobulin reacting with the antigen and a method for screening the infection of retrovirus other than HIV-1, HIV-2 subtype A which can be collected from an AIDS patient blood by the above antibody measurement. The method can diagnose exactly
   each other and host material. (Updated on 25-MAR

RESULT 245 AAV32006/c

PCR primers AAT87852 and AAT87853 are used to amplify nucleic acid from the Hepatitis C Virus (HCV) for use in a novel method for separating single stranded HCV RNA from double stranded HCV RNA. This method involves contacting the sample with a liquid comprising a chaotropic agent and a nucleic acid binding solid phase, having a composition so that double stranded nucleic acid binds the solid phase and single stranded nucleic not, and separating the solid phase from the supernatant. This method can be used to separate and detect causative

Separation of single and double stranded hepatitis C virus RNA - u liquid comprising chaotropic agent and nucleic acid binding phase,

particularly silica particles.

```
AAV22531-89 represent antisense oligonucleotides which are targeted against the mRNA of the R1 subunit sequence of ribonucleotide reductase. Abergasian of the R2 gane, which encodes the second subunit of the ribonucleotide reductase gane, can determine the mailgnant of characteristics of cells. Suppression of R2 and R1 gene expression was found to reduce transformed properties of tumour cells. The antisense oligonucleotides can be used for modulating tumour cell growth, or for inhibiting tumour cell proliferation. They can also be used for increasing the sensitivity of neoplastic cells to chemocherapeutic drugs (especially to hydroxyurea, methotrexate (MTX), and PALA). The antisense oligonucleotides may be used to treat proliferative disorders including leukæemias, lymphomas, sarcomas, methotrexate (MTX), and PALA). The antisense closencier, papillomas, arthrosclerosis, psoriasis, polythemia, mastocytosis, autoimmune diseases, angiogenesis, bacterial infections and viral infections (including HIV hepatitis, or herpes infections)
                                                                                                                                                                                                                                                                                                                                                                     Antisense oligonucleotides to ribonucleotide reductase genes - used to modulate tumour growth and inhibit tumour cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.7%; Score 14.4; DB 1; Length 20; 93.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              coding strand of a published CDNA sequence for flax stearcyl-acyl carrier protein desaturase (SAD) cDNA. It was used as a PCR primer, together with oligonucleotide primer OL-110 (see AAV320007), in an inverse PCR amplification of flax genomic DNA. The 5' regulatory regions (see AAV32000-01) of the flax SAD1 and SAD2 genes (see also AAV31998-99) were obtained. These SAD gene promoter sequences can be used to enhance or enable the expression of genes introduced into flax or other plants, especially to to manipulate the fatty acids of membrane and storage

The INVENTION TEATURE TO The numbar AFCI Choisesteror transporter protein controlled acid sequences (169120) which encode it. ABCI is a member of the ATP-binding casette (ABC transporter) superfamily of a member of the ATP-binding casette (ABC transporter) superfamily of proteins, and plays a crucial role in cholesterol substantial fall memorytes and fibroblasts, beang involved in cholesterol trafficking in monocytes and fibroblasts, beang involved in cholesterol trafficking in monocytes and fibroblasts, beang controlled in cholesterol trafficking in monocytes and fibroblasts, beang located on chromosome 9g1, and mutations in this gene encoding ABCI is located on chromosome 9g1, and mutations in this gene encoding ABCI is and familial IMD deficiency (HRM). These diseases with two genetic (HD) and familial IMD deficiency (HRM). These diseases are distinguishable in that TD is an autosomal recessive disorder, while cholesterol!) in the blood correlate with a high risk of cardiovascular disease. The invention provides genetic constructs and disease, coronary restenosis, and peripheral vascular disease. Conversely, a high level of HDL has protective effects against cardiovascular disease. The invention provides genetic constructs and cransporn cells and non-human animals comprising human ABCI nucleic cardiovascular disease comprising the administration of an expression vector encoding ABCI or an active fragment thereof. The invention also encompasses compounds which mimic ABCI activity, compounds which mimic ABCI or an active fragment thereof and compounds which mimic ABCI determining whether a patient has an increased risk for cardiovascular disease corporary aretenosis or peripheral vacular disease. Cerebrovascular disease, sepecially coronary aretery disease, intringent disease, coronary restenosis or peripheral vaculations disease, coronary restenosis or peripheral vacular disease. They may also be used in the treatment of disease, Niemann-Pick disease. They may also be used in the treatment of disease, which t

The present sequence is an antisense oligonucleotide directed against the mRNA encoding the R1 component of mammalian ribonucleotide reductase. Ribonucleotide reductase catalyses the conversion of ribonucleotides to their corresponding deoxyribonucleotides and thus plays an important role in DNA synthesis and cell proliferation. Regulation of ribonucleotide reductase is altered in cultured malignant cells and increased levels of R2 protein and R2 mRNA have been found in pre-malignant and malignant tissues as compared to normal control tissue samples. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antisense sequence is therefore useful for inhibiting tumourigenicity of morplastic cells and inhibiting metastasis of tumour cells. It is also useful for increasing sensitivity of neoplastic cells to chemotherapeutic drugs, thus allowing chemotherapeutic treatments to be used in patients
                                                                                              Antisense oligonucleotide; ribonucleotide reductase; R1 protein;
R2 protein; tumour cell proliferation inhibition; cancer; cytostatic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        who have become resistant or less sensitive to chemotherapy. The sequence
may be RNA or DNA and may comprise a modified backbone and/or nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotide, AS-I-618-20, is useful for inhibiting
                                                      Ribonucleotide reductase RI message antisense oligo AS-I-1162-20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 12 A; 3 C; 4 G; 1 T; 0 U; 0 Other;

sequence represents a PCR primer used in cloning of cDNA encoding a human ankyrin 4 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                       Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin Bl. Representative examples of ribozyme recognition sites are given in AAA82215 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                               g
                                                                                                                                                                  ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ÷
                                                                                                                                                                                                                                                                                                                                           The present invention provides antisense oligonucleotides with phosphorothicate backbones directed at the human E2F transcription factor 3 (E2F-3) coding sequences. These can be used in the therapy of diseases which can be treated by modulating E2F-3 expression and to prevent inflection, inflammation and tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a human ankyrin 4 polypeptide and the polymucleotide encoding it. The sequences are used for treating diseases of the nervous system and nervous system related diseases and for diagnosing the diseases relative to them by detecting a mutation in the nucleic acid sequence and by monitoring the ankyrin protein level. The method is useful for isolating a wide variety of microorganisms, specifically bacteria, in parasites, particularly those which are able to bind the complex parasites, particularly those which are able to bind the complex polysaccharides found on human cell, to isolate simultaneously bacteria and other types of microorganism, such as algae, protozoa, fungi or viruses, or to capture all types of white blood cells from a blood or blood derived sample, from bone marrow or any tissue or fluid containing white blood cells. The present sequence is a PCR primer which is used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, ribozyme therapy, hairpin ribozyme, hammerhead ribozyme, recognition site; target, ribozyme binding site; eye disease, vulnerary, proliferative disease, skin disease, psoriasis, diabetic, retinopathy, cytokine, inflammation, cell-cycle dependent kinase, cyclin, MWP, matrix metalloproteinase, growth factor; reductase; scarring, cytostatic, antipsoriatic, dermatcological, antiseborrhaic; antidiabetic, virucide, antisickling, ophthalmological, keracolytic, gene therapy, viral wart; atopic dermatitis, actinic keratosis; squamous cell carcinoma;

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, copthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, caumous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                   Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, dopamine receptor D2, DRD2, polymorphism, allele specific, drug target isogene, detection; single nucleotide polymorphism; SNP; genotype, schizophrenia, Parkinson's disease, myoclonus dystonia; MD;

The invention relates to a mammalian K+ channel protein with two pore domains, called TREK2 (TWIK-Related K+ Channel). The protein produces currents whose current-voltage relationship is slightly inwardly rectifying in high symmetrical K+ conditions. TREK2 is a member of the fatty acid-activated and mechanosensitive K+ channel family. TREK-2 gene located on chromosome 14911 is abundantly expressed in Kidney, pancreas and moderately in testis, brain, colon and small intestine. The mammalian K+ channel protein is useful in methods for screening various compounds. In particular, the protein is useful in methods for identifying biologically active compounds with massethetic properties. The present sequence is reverse transcription (RT) PCR primer used for analysing human TREK-2 gene exon-intron-exon DNA sequence used in the invention
                                                                                                                                                                                                                                                                                                                                                                              New mammalian K+ channel protein with two pore domains, for screening various compounds, particularly for identifying biologically active compounds with anesthetic properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes polynucleotides comprising single nucleotide polymorphisms (SNPs) in the human dopamine receptor D2 (DRD2). The polynucleotides may be used in assays to detect and characterise polymorphisms in DRD2 that affect its expression and activity and are polymorphisms in DRD2 that as schizophrenia, Parkinson's and myoclonus of without a (MD). This information would be useful for studying the biological function of DRD2 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. Polymorphisms in the DRD2 gene affect the expression or functional polymorphisms in the DRD2 gene and how those comparatageous to detect polymorphisms in the DRD2 gene and how those polymorphisms are combined in different copies of the gene. AAF70261 to AAF70309 to AAF70404 represent human DRD2 allele specific oligonucleotide primers which are used in the detection of DRD2 polymorphisms. AAF70405 cpresent oligonucleotide primers for the detection of the present DRD2 polymorphisms which are given in the exemplification of the present correction. AAF70453 trepresent oligonucleotide primers for the human DRD2 correction. AAF70453 trepresent oligonucleotide primers for the human DRD2 correction. AAF70455 trepresent oligonucleotide primers for the human DRD2 correction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the nucleotide sequence of a primer termed 2565r. A set of primers (see AAZ19971-73) including 2565r was used in the PCR amplification and sequencing of genomic fragments of the human uncoupling protein 2 (UCP2) gene (see AAZ19967). The invention provides a method for identifying a subject having a risk of developing obesity and/or type II diabetes mellitus by detecting the presence of a single nucleotide polymorphism in UCP2 or UCP3 nucleic acid (see AAZ19967-70)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of uncoupled protein 2 or 3 as markers for identifying subjects at risk of developing obesity or diabetes.

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae causes respiratory disease such as pneumoniae causes respiratory disease such as monomian and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584- AAX36879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis.                                                                                                                                                                                                                                                                                        AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; amplification; single nucleoride nolymonal.

diagnosis; ss Homo sapiens.

```
The present invention describes the detection of drug-selected mutations in the HIV protease gene. The method of detection allows the simultaneous characterisation of a range of codons involved in drug resistance using sets of probes optimised to function together in a reverse-hybridisation assay. AAZ97517 to AAZ97997 represent specifically claimed probes for use in the assay, and AAZ97799 represent specifically claimed HIV protease gene polymorphic nucleotide sequences. AAZ97502 to AAZ97515, and AAZ98004 to AAZ98007, represent probe used in an example from the prosent invention. The method, probes and primers can be used for the detection of drug-selected mutations in the HIV protease gene. The method allows the simultaneous characterisation of a range of codons involved in drug-seistance. The method may also be used for HIV protease genoryping assays. The probes are able to discriminate between wild type and mutated protease sequences. The method allows rapid and reliable detection of drug-selected mutation in HIV. (Updated on 15-SEP-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of drug-selected mutations in the HIV protease gene used to treat HIV infections.

AAZ65654 to AAZ69578 represent human biallelic markers from the present nucleotide sequences. AAZ69579 to AAZ740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haploryping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agence and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

This invention describes novel isolated, preferably recombinant, polypeptides (I) containing the amino acid sequence for human procalcitonin (hpCT). The products of the invention have antitumor, antisepsis and antinflammatory activity. (I) (also antibodies (Ab) raised against it) are used: (I) for diagnosis and treatment of tumors, sepsis and systemic inflammatory response syndrome, (ii) to raise Ab; (iii) for quantitative or qualitative detection and analysis, especially of hpCT and antibodies against it; (iv) as controls or standards for assays; and (v) for affinity offromatography. Isolated (I) can be produced inexpensively in large amounts by recombinant expression. Solutions of (I) that contain a polyethoxylated sterol ester have good storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New, preferably recombinant, human procalcitonin, useful for diagnosis and treatment of sepsis, tumors and systemic inflammatory response
                                                                                         Procalcitonin; pCT; antitumor; antisepsis; antiinflammatory; tumor; sepsis; systemic inflammatory response syndrome; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                stability. This sequence represents a PCR primer used in the amplification of human procalcitonin pCT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytotoxin; cancer; transcription coupled repair; TCR; nucleotide excision repair; NER; antisense; cytostatic; Xeroderma pigmentosum group A; XPA; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0.7%; Score 14.2; DB 1; Length 20;

The present invention relates to a method for potentiating or enhancing the toxic effect of a cytotoxin or oxidising agent on a cancer cell, comprising contecting the cell with an oligonucleotide complementary to a gene involved in transcription coupled repair (TCR) and nucleotide excision repair (NER) and with a cytotoxin or oxidising agent. The invention is used to sensitise cancer cells to therapeutic agents. The present sequence is an antisense oligonucleotide directed against Xeroderma pigmentosum group A (XPA) gene
                                                                                                                                                                                                                                                              Increasing sensitivity of cancer cells to a cytotoxin or oxidizing agent useful for therapy comprises contacting them with oligonucleotides complementary to transcription coupled repair or nucleotide excision
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human glioma-associated oncogene-1 antisense oligonucleotide ISIS 124905.

The present invention relates to antisense compounds, compositions and methods for modulating the expression of MEKK4 (also referred as mitogenactivated protein kinase kinase 4; MAPIKK4 (also referred as uitogen-kinase kinase kinase binase 1; MAPIKKK4 in Calle or tissues. They are also inhibiting the expression of MEKK4 in cells or tissues. They are also with MEKK4 such as immunological, inflammatory, hyperproliferative disorder or cancer. Sequences of the invention are also useful for disorder or cancer. Sequences of the invention are also useful for disgnostics, therapeutics, prophylaxis and as research reagents and kits. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human MEKK4 DNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phosphorothioate; HIV-1; azasugar; AIDS; virucide; antiviral; anti-HIV;
                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to nucleic acid encoding mitogenactivated protein kinase 4, useful for treating immunologic disorder,

                                                                                                                                                  The present invention relates to antisense compounds and methods for modulating the expression of human glioma-associated oncogene-1. The antisense compounds, particularly antisense oligomuclectides, target and inhibit the expression of human glioma-associated oncogene-1. The antisense compounds are useful for inhibiting the expression of human glioma-associated oncogene-1 in human cells or tissues and for treating an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of glioma-associated oncogene-1. The compounds are useful for diagnostics, therapeutics and as inflammation or tumour formation. The antisense compounds are safely and effectively administered to humans. ABMS 30509-ABMS 30586 represent the antisense oligomuclectides of the invention which comprise a

The present sequence is that of a phosphorothicate oligomuclectide of random sequence which includes 4 six-membered azasugar nuclectide derivatives. It is a claimed example of oligomuclectides of the invention (see AWD73816-41) that have been tested as AIDS therapeutic agents. In anti-HIV-1 assays, the oligomuclectide showed higher antiviral activity than AZT, ddC and ddI, and antiviral activity was resistant to the effects of serum. Claimed oligomuclectides of the present invention have low toxicity against cells, are membrane permeable, working outside of cells to inhibit viral attachment of HIV, have a wide antiviral activity viruses including SIV. The resistance of the present oligomuclectide to serum allows its use as an AIDS therapeutic drug in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New phosphorothioate oligonucleotides useful in the treatment of AIDS.

first active agent comprising an oligomodicotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleities of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antialfammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed a specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      first active agent comprision in interpretation of the interpretation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent composition of the invention and antifinamatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in attisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entilinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine ceptor, producing bronchodilation, increasing levels of ubiquinone or lung suffactant in a subject stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at the printed and

                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides, useful for modulating the expression of C-reactive protein or for treating a disease or condition associated with the expression of C-reactive protein, e.g. unstable angina or myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes antisense oligonucleotides which are targeting to DNA encoding C-reactive protein. The antisense compounds are useful for modulating the expression of C-reactive protein, and for treating a disease or condition associated with expression of C-reactive protein, e.g. cardiovascular disease, such as unstable angina or myocardial infarction. ABZ77222-75 represent antisense oligonucleotides of the invention, directed against human C-reactive protein gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, mucin 1 transmembrane, hyperproliferative disorder, cytostatic, inflammatory disorder, gene therapy, H23-ETA transmembrane antigen, antisense, episialin, epitectin, polymorphic epithelial mucin, CD227, peanut-reactive urinary mucin; PUM; epithelial membrane antigen; BMA, PEM, NCRC11, H23 antigen; DF3 antigen; phosphorothicate backbone; MUC1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ņ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention relates to antisense oligonucleotides targetted to a nucleic acid encoding mucin 1 transmembrane (also known as MUC1, epistalin, epitectin, polymorphic epithalial mucin, FBM, peanut-reactive uxinary mucin; PUM, epithelial membrane antigen; BMA, PAS-0 NCRC11, H23 antigen, H22-ETA transmembrane antigen, DF3 antigen and CD227) to inhibit/modulate the expression of mucin 1 transmembrane. Antisense compounds of the invention are useful for preparing compositions for treating hyperproliferative or inflammatory disorders. The invention is also used in gene therapy, The present sequence is human mucin 1
                                                                                                                                                                                                                                                                                                               New compound, having a sequence targeted to a nucleic acid encoding 1, transmembrane, useful for preparing a composition for treating hyperproliferative or inflammatory disorders.

New growth hormone 1 (GH-1) diagnostic polynucleotide, useful as markers for the analysis of a disease, or of susceptibility to drug treatment for GH-1 dysfunction or other diseases.

Example 2; Page 30; 74pp; English.

#X###X#X0000000XX

The invention relates to growth hormone 1 (GH-1) gene including single mucleotide polymorphisms (SNP). The GH-1 diagnostic polymucleotide is useful as markers for the analysis of a disease, of susceptibility to drug treatment for GH-1 dysfunction or other diseases, or may be included in any complete or partial genetic map of the human genome. GH-1 mutant polypeptides are useful as antagonists of GH-1 hormone action.

Polymucleotides encoding these polypeptides are useful in gene therapy. The present sequence is a PCR primer used for amplifying human GH-1 gene

isolated nucleic acid, useful for treating viral diseases associated tumners and cell degeneration, also related polypeptides, antibodies and transfected cells. with tumors

Disclosure; Page 103; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence, at ther optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one

ö This sequence represents a probe for the RT pol region of hepatitis b virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (1) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample with at least 1 suitable primer pair. (b) hybridising (1) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from Probe; hepatitis b virus; HBV detection; RT pol region; genetic analysis; precore region; HBsAg region; genotype specific target; mutation detection; ss. component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention Detection and/or genetic analysis of hepatitis B virus - specifically genotype, preCore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs.
